CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

## ANNOTATION OF FEATURES:

STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the BST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the SEQUENCING READ COVERAGE: Sequencing is completed to a minimum annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html

OMMENT

```
INFORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlapping sections once, or longer because we arrange for a small this sequence is the entire insert of clone C01B9. The true left end of clone ZK131 is at 18285 in this sequence. The true right end of clone R06B9 is at 100 in this sequence. The start of this sequence (1. 100) overlaps with the end of sequence CER06B9.

The end of this sequence (24951, .25233) overlaps with the start of sequence CEZK131.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23035 ATAAGCTTGCTAATTTTTTCTGGCTTTTTTTAAATAGAAATATAGAAAATATAGGAAATATCGGCTG 22976

Submitted (13-MAY-2003) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On May 13, 2003 this sequence version replaced gi:25086297.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature Submitted (09-NOV-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (bases 1 to 227182)
Rat Genome Sequencing Consortium. (bases 1 to 227182) Worley, K.C. Direct Submission

```
* NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a "working draft" sequence. It currently

* consists of 3 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N. but the exact sizes of the gaps are unknown.

* This record will be undated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

```
This invention describes novel copper-containing ribonucleoproteins which are ternary complexes of an $100 protein, copper ions, and RNA comprising the following consensus sequence or its complement GGAAAAUNNUNDARGAIGNIGCUNNNUUUNNNNNNAAAAANO-LTANAAACANO-SCUNNACHO-33AGAA-AUNO-16UUAGCAS where N = G, A, U or C. The ribonucleoproteins are stated to have the following properties (1) cell-selective morphogenic action in vitro on isolated primary and/or cloned blood capillary endothelial cells in culture for the non-mitogenic induction of the change in cell phenotype from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Continuation (6 of

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                 insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and insecticides. Interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL0404L16175) and the encoded proteins (ABBS7737-ABR30222). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4829 BP; 1251 A; 1183 C; 1154 G; 1241 T; 0 U; 0 Other;

New genes and gene products isolated from human prostate, useful for treating or diagnosing tumor or cancer (e.g. prostate cancer or breast cancer), or as vaccines for treating or preventing these diseases.

```
Complement. The polynucleotides and gene products are useful for treating or diagnosing tumour or cancer (e.g. prostate cancer, breast cancer, lung cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also polynucleotides and polypeptides are also polynucleotides are useful for gene therapy. The present sequence is that off one of a group of polynucleotides (AsQ88745-AB20015) disclosed electronically as sequences of the invention. However only 1271 polynucleotides are given, whereas 1477 polynucleotides and 91 proteins are claimed. Note: The sequence this peacent did not proteins are claimed. Note: The sequence character of this peacent did not

polynucleotides, and includes the derived probes, antisense oligonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and/ or vaccines they can be used to modulate the immune response for the prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in the specification but are provided on the WIPO website.

The polynucleotides and gene products are useful for treating or diagnosing tumour or cancer (e.g. prostate cancer, breast cancer, lung cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynucleotides are useful for gene therapy. The present sequence is that of one of a group of polynucleotides (ABQB8745-ABQ90015) disclosed
cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and/ or vaccines they can be used to modilate the immune response for the prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in

electronically as sequences of the invention. However only 1271 polynucleotide sequences are given, whereas 1477 polynucleotides and 91 proteins are claimed. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequence

New polynucleotides derived from human prostate, useful for modulating immune response to prevent or treat cancer.

Claim 1; SEQ ID NO 418; 188pp; English.

This invention relates to novel isolated polynucleotides of human origin, particularly isolated from the human prostate. Specifically, it refers to the diagnostics and therapeutics comprising these novel human polynucleotides, and includes the derived probes, antisense oligonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and/or vaccines they can be used to modulate the immune response for the prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in

New genes and gene products isolated from human prostate, useful for treating or diagnosing tumor or cancer (e.g. prostate cancer or breast cancer), or as vaccines for treating or preventing these diseases.

Claim 1; SEQ ID NO 416; 186pp + Sequence Listing; English.

The invention relates to an isolated polynucleotide comprising any of 1477 sequences or its fragment, degenerate variant, antisense or complement. The polynucleotides and gene products are useful for treating or diagnosing tumour or cancer (e.g. prostete cancer, breast cancer, lung cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynucleotides are useful for gene therapy. The present sequence is that of one of a group of polynucleotides (HADO8745-ABQ90015) disclosed electronically as sequences of the invention. However only 1271 polynucleotide sequences are given, whereas 1477 polynucleotides and 91 profess are claimed. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequence

The invention relates to an isolated polynucleotide comprising any of 1477 sequences or its fragment, degenerate variant, antisense or complement. The polynucleotides and gene products are useful for treating or diagnosing tumour or cancer (e.g. prostate cancer, breast cancer, lung cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats, rabbits, horse or human). The polynucleotides and polypeptides are also useful as vaccines for treating or preventing these diseases. The polynucleotides are useful for gene therapy. The present sequence is that of one of a group of polynucleotides (ABQB8745-ABQ90015) disclosed electronically as sequences of the invention. However only 1271 polynucleotide sequences are given, whereas 1477 polynucleotides and 91 proteins are claimed. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

New polynucleotides derived from human prostate, useful for modulating immune response to prevent or treat cancer.

Claim 1; SEQ ID NO 1307; 188pp; English.

origin, efers to prevention or treatment of cancers, particularly of the prostate, but also for breast, lung and colon cancer. This polynucleotide sequence is a human cDNA sequence useful for the treatment of cancer, used in an exemplification of the invention. NOTE: These sequences are not given in This invention relates to novel isolated polynucleotides of human origin, particularly isolated from the human prostate. Specifically, it refers to the diagnostics and therapeutics comprising these novel human polynucleotides, and includes the derived probes, antisense oligonucleotides and antibodies thereof. The identification of these human prostate genes that can inhibit tumour growth is useful for understanding the progression and nature of complex diseases such as cancer, and hence they are important in the drug discovery process. The present invention describes these polynucleotides and encoded polypeptides as exhibiting cytostatic activity, and through gene therapy and/or vaccines they can be used to modulate the immune response for the the specification but are provided on the WIPO website.

WPI; 2001-582041/65. P-PSDB; AAU27322 Estrogen receptor gene and protein polymorphisms useful for diagnosis of individuals at risk of developing bone disorders.

Example 2; Fig 1; 245pp; English.

The invention relates to a novel isolated peptide comprising or consisting of an amino acid sequence selected from an amino acid sequence consisting of an amino acid sequence selected from an amino acid sequence of a variant osstrogen receptor protein (e.g. RBbeta), or a fragment of 10 amino acids), antibodies against them, inclaic acids encoding them clocated on chromosome 67.25.1. The variant seem coded by single nuclectide polymorphisms (SNP). The variant peptides and proteins can be used in assays to determine the biological activity of the protein, to used in assays to determine the biological activity of the protein, to determine levels of the protein in biological fluids, to identify compounds that modulate receptor activity and to screen compounds for the ability to stimulate or inhibit interaction between the receptor protein and a target molecule that normally interacts with the receptor protein e.g. osetrogen. The antibody can be used to isolate the protein, to assess expression in disease states e.g. cardiovascular disease and autoimmune disease (e.g. systemic lupus erythematosus, arthritis, rheumatism and oslecarthritis), osteoporosis, breast cancer and endometrial cancer. In addition the antibodies can be used in pharmacogenomic analysis and inhibiting protein function, e.g. blocking the binding of the oestrogen receptor protein to a binding partner such as a ligand. The nucleic acide encoding the proteins can be used as probes, primers, chemical intermediates and in biological assays. The present sequence is the human Erbeta gene

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlDS, epilepsy, neurofibromatcsis, rheumatcoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antinfeumatic, antiarthritic, antidiabetic, antipsoriatic, antinflammatory, cancer, eye disease, arteriosclerosis, anaemia, acute myeloid leukaemia, Alzheimer's disease, AIDS; epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis, bowel disease, gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  system disease; cytosine methylation; antiasthmatic;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 32,

                                                                                             This sequence is from a Xenopus Gene Collection (XGC) library constructed by Aaron M. Zorn.
CDNA was oligo dT primed from 5ug of poly A+ RNA from neurula.
BCORI-NOLI cut cDNA was then ligated into pCS107 with EcoRI at the 5, end and NoLI at the 3' end.
Vector: pCS107; Site 1: EcoRI; Site 2: NotI
Host: Escherichia coli DH10B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
